

FLOOR PLAN — STAGE 1: FIX THE ROOMS

STAGE 1 OF 2

Correct the room shapes, sizes and positions. **Devices come in stage 2** — ignore them entirely for now.

MARKUP SHEET · 22 SEP 2026
BASE GEOMETRY: SHARKY LIDAR, AUG 13

Not to scale · geometry approximated from the vacuum's LIDAR map · rooms it could not enter are hatched

WHAT I NEED CORRECTED

- **Room positions** — which room is actually next to which
- **Rough sizes** — even “this one is twice that one” helps
- **Rooms that are missing entirely** — add them anywhere and label them
- **Where the GARAGE really sits** relative to the kitchen and living room. The base drawing says “*position approximate*” and it is drawn detached — almost certainly wrong.
- **OFFICE and GUEST BEDROOM shapes** — both hatched because Sharky could never get in (the doors were shut), so both are pure guesses. **The office matters most** — the RE200 and the B-hyve both live there.
- **Exterior walls** — mark which walls are outside walls, and which are brick

What is already known to be right:

the solid rooms (bedroom, bathroom, foyer, hall/bath, living room, kitchen+dining) came from Sharky's LIDAR, so their shapes are real even if their placement drifted. The two hatched rooms and the garage are the guesses.

Stage 2, after this comes back: I

redraw the plan to match your corrections, then hand you the 38-number device key to place. Keeping them separate so you are not marking

devices onto rooms that are about to move.
