

THE SHELL — REV M

PHOTOS READ

REV M · 22 SEP 2026 8:28 AM · CORRECTED FROM THE EXTERIOR SHOTS
ANCHORED ON THE 12×24 GARAGE

Porch redrawn RECESSED into the foyer — the front-door view proves it. The 12×8 moved from south of the garage to north, and the rear elevation backs you up. Deck shortened, chimney found on the east, hallway turned 90° so those two doors can face.

THE ROOMS — same scale. The hallway tile is now TURNED 90°.

Nothing taken out. You said the guest bedroom and office doors ARE straight across — that only works with the hallway as a 4 ft × 18 ft spine and those two rooms flanking it.

I LOOKED AT THE OUTSIDE SHOTS. THREE THINGS CHANGED.

- ✓ **THE PORCH IS RECESSED** — you were right, and the front-door view proves it. Looking out from the front door there is **brick wall on BOTH sides** with the porch ceiling running over them, and railings only at the step opening. That is a porch **cut into** the footprint, not one hung off the front of it. Redrawn as a **10 × 6 notch in the north wall opening straight into the foyer** — “it tucks inside to where it comes into the foyer.”
- ✓ **The 12 × 8 moved from the south side of the garage to the north.** Garage is still exactly 12 × 24. **The rear-elevation shot independently backs you up:** the back wall is **continuous brick right across the garage end** — no notch, no step-back. Had that space still been on the south side there would be a visible jog in the back wall, and there is not one.
- ✓ **The back deck is SHORTER than I drew it.** Same photo: the deck starts about a third of the way along the rear and runs east. The whole garage end of the back wall is **plain brick with one small window and no deck**. Was 40 ft, now **26 ft**, with the step-down at its west end where the photo shows it.

🔍 **One more thing that shot settles: THE CHIMNEY IS ON THE EAST HALF OF THE ROOF.** So the **fireplace** — and the living room with it — **sits at the EAST end**, not in the middle where I had been drawing it. Marked on the plan. This is what you meant by pulling it all together: the picture knows where the fireplace is.

⚠ **Your last two corrections do not fit together, and I want you to place one tile rather than have me guess.**

✓ **"the doors in the guest bedroom and the office are straight across from each other"** — taken. That is only possible with the hallway as a **4 ft wide, 18 ft long spine** and those two rooms on either side of it, so **the hallway tile is turned 90°** on this sheet.

✓ **"the living room southwest corner is really the office — I told you wrong"** — also taken. But that puts the **office in the SOUTHWEST**.

► **The conflict:** you also told me the **RE200 is in the office, and the B-hyve is on the outside wall of the office, through the brick** — and the B-hyve is on the **EAST** wall, which you confirmed separately. **The office cannot sit in the southwest and share a brick wall with the B-hyve on the east.** One of the two is off, and I am not picking for you.

Put the OFFICE tile where it really goes and everything else falls in behind it — guest bed goes across the spine from it, and the living room takes what is left around the fireplace at the east end.

Unchanged: shell $44 \times 32 = 1,408$ sf, garage $12 \times 24 = 288$ sf, tiles total 1,408 sf. Supply trunk drawn off the duct scope — **16" at the unit on the**

east, 12" at the garage end on the west.
