

FLOOR PLAN — DEVICE OVERLAY

DRAFT — CHECK ME

Base geometry traced from the robot vacuum's map · device positions are my best guess and need your red pen

DRAFT 1 · AUG 13 2026

TRACED FROM SHARKY LIDAR

KEY

- S** Kasa smart switch
- R** Zigbee plug (mesh router)
- D** Zigbee door sensor
- H** Beehive hub + coordinator
- DR** Doorway
- [Hatched]** Not mapped / approximate

Please correct me. Mark this up and hand it back — I'll redraw it properly. I need:

- Room positions & rough sizes
- Where the garage really sits
- Guest bedroom & office locations
- Which wall each switch is on
- Any rooms missing entirely

Next version can be live. Once the geometry is right, this same plan can drive the wall iPad — lamps lighting up when they're on, the garage door showing open or closed, and a tap to control anything on it.

WHY ROOMS ARE HATCHED

The vacuum maps only where it can drive. With the guest bedroom and office doors shut, it read those doorways as solid wall — so those rooms are guesses, not survey. The garage it has never seen at all.

Not to scale · geometry approximated from the vacuum's LIDAR map · rooms it could not enter are hatched
