

Eight Measurements

TAPE ONLY

Not the whole house. These are the tape pulls with the most leverage, ranked — **if you only do three, do A, B and C.** Six of the eight are from outside or along a single wall, so nothing has to be moved to reach them.

Why so few? The plan is already internally consistent — every room is a real rectangle and the schedule totals exactly to the outline. **What it lacks is one true dimension to hang on besides the garage.** A and B give it the outside box; C fixes the wall I have moved more than any other. Everything else is squeezed between those three.

A	HOUSE WIDTH	★★★	ft	in
Outside, along the back wall. House only — do NOT include the garage. The whole drawing is fitted inside 44 ft. If that is wrong, every room in the house is wrong.				
B	HOUSE DEPTH	★★★	ft	in
Outside, down the east side, front wall to back wall. 32 ft is my number, not yours. A and B together fix the box everything else is squeezed into.				
C	EAST WALL → the wall between the OFFICE and the LIVING ROOM	★★★	ft	in
Inside, along the back wall. The wall I have moved more than any other today. It sets the office size, the living room size, AND how long the real corridor is.				
D	MASTER BEDROOM WIDTH	★★	ft	in
Inside, west wall to east wall. Biggest room in the house and the anchor for the whole west half.				
E	MASTER BEDROOM DEPTH	★★	ft	in
Inside, front wall to back wall. With D, pins the master bath, laundry and dining sitting below it.				
F	PORCH OPENING WIDTH	★★	ft	in
Outside, across the front of the cubby, brick to brick. You said 12 ft, I drew 8. One of us is wrong, and it moves the foyer.				
G	WEST CORNER OF THE HOUSE → near edge of the PORCH	★★	ft	in
Outside, along the front wall. Fixes where the porch actually sits, and with it the master bed / foyer split.				
H	HALLWAY WIDTH	★	ft	in
Inside the walled part of the corridor, wall to wall. I have 4 ft. Small, but it is load-bearing for the two doors facing each other.				

How to read them back to me: just the letter and the number — “A is 46 4”. Feet and inches is fine, I will do the arithmetic.

And if a number comes back and the rooms stop adding up, that is the point. It means something I inferred was wrong, and I would far rather find it now than leave it on the drawing looking measured.

Deliberately NOT on this list: the **garage** (already taped at 12×24 — it is the anchor and it stays), the **closets** (you said you do not need them), and the **back deck** (outside the heated box, nothing depends on it).
